CANADIAN CLIMATE NORMALS

**1951 – 1980
VOLUME 2
TEMPERATURE**

PREFACE

Canadian Climate Normals is a series of separate volumes of climate data for temperature, precipitation, wind, sunshine, etc., each on a national basis. The data comprises: normals based on the period 1951 to 1980, which is the current 30-year period for climate normals as recommended by the World Meteorological Organization; extremes from the entire period of record at each station up to and including 1980; and other statistics such as frequencies, percentiles and standard deviations depending on the element.

This volume provides normal values of temperature in degrees Celsius for all climate stations for which at least five years of records exist in the period 1951 to 1980. For the first time a statistical method is used to adjust data for short-period stations. The stations are arranged alphabetically by provinces and territories.

The values in this book are from the same data in Temperature and Precipitation Normals 1951-1980 published in six regional volumes.

NORMALES CLIMATIQUES CANADIENNES

**1951 à 1980
VOLUME 2
TEMPÉRATURE**

PRÉFACE

La série "Normales climatiques canadiennes" se compose de volumes de données climatologiques à l'échelle nationale distincts pour la température, les précipitations, le vent, l'insolation, etc. Les données englobent les normales pour la période s'étendant de 1951 à 1980, soit la période de 30 ans actuellement recommandée par l'Organisation météorologique mondiale, les extrêmes pour toute la période de relevé à chaque station jusqu'à 1980 y compris et d'autres statistiques, comme la fréquence, le centile et l'écart type selon l'élément météorologique dont il est question.

L'ouvrage présente les valeurs normales de température en degrés Celsius pour toutes les stations climatologiques pour lesquelles il existe au moins cinq ans de relevés entre 1951 et 1980. Les stations sont rangées alphabétiquement par province et par territoire. C'est la première fois qu'on se sert d'une méthode statistique pour corriger les données des stations ouvertes depuis peu.

Les données du présent livret figurent également dans les six volumes régionaux de Température et précipitations 1951-1980.

VOLUME 2

TEMPERATURE

NORMALES CLIMATIQUES CANADIENNES

1951 à 1980

VOLUME 2

TEMPÉRATURE

1. Introduction

The normal of a climate element is defined as the arithmetic mean of the observed values of that element over a specific period of time. The true mean, that is, the mean of all possible observations, can never be known exactly, but must be estimated from some sample of the past record. The normals presented here are estimates of the true mean obtained in the 30-year sample record, 1951 to 1980.

This volume contains tables of monthly and annual normals of temperature for 2250 stations that have an appreciable length of record. The actual period of record used to compute each normal is indicated by a code number that is displayed following the corresponding annual value in the tables. The stations are arranged in alphabetical order under each province or territory.

2. Temperature Observations

Air temperature measurements are made from self-registering maximum and minimum thermometers set in a louvered, wooden shelter. The shelter is mounted on a stand so that the thermometers are approximately 1.5 m above ground, which is usually a level, grassy surface, with the nearest obstacle being at least four times its height away.

At most stations the maximum temperature is read twice daily from a mercury-in-glass thermometer. The maximum temperature for a given day is the highest temperature in the 24-hour period following the scheduled morning observation. Thus, the maximum temperature read each morning is credited to the previous day. The minimum temperature for a given day is read from an alcohol minimum thermometer and is the lowest temperature in the 24-hour period following the evening observation of the previous day.

1. Introduction

La normale d'un élément climatique est la moyenne arithmétique des valeurs de cet élément, relevées sur une période donnée. La vraie moyenne, c'est-à-dire la moyenne de toutes les observations possibles, ne peut jamais être déterminée exactement; elle doit être estimée à partir d'échantillons des relevés passés. Les normales qui figurent ici sont des estimations de la vraie moyenne obtenues à partir des relevés faits sur la période de 30 ans, de 1951 à 1980.

Le présent volume contient seulement les normales mensuelles et annuelles de la température pour les 2250 stations, dont les relevés s'échelonnent sur une assez longue période. La période réelle de relevés utilisée dans le calcul des normales est indiquée par des codes numériques qui suivent les valeurs annuelles. Les stations sont énumérées en ordre alphabétique.

2. Mesures de la température

Les mesures de la température de l'air s'effectuent à l'aide de thermomètres enregistreurs à maximum et à minimum, placés dans un abri météorologique à persiennes en bois, à environ 1,5 m du sol. Cet abri se trouve habituellement sur un terrain plat et herbeux, où l'obstacle le plus proche est à une distance d'au moins quatre fois sa hauteur.

À la plupart des stations, on prend deux fois par jour la température maximale à l'aide d'un thermomètre au mercure sous verre. La température maximale d'une journée donnée est la température la plus élevée de la période de 24 heures qui suit l'observation du matin prévue à l'heure. C'est pourquoi la température maximale lue chaque matin est reportée à la journée précédente. On lit la température minimale d'une journée donnée à l'aide d'un thermomètre à minimum à alcool. La température minimale est la température la plus basse relevée au cours de la période de 24 heures qui suit l'observation faite en soirée le jour précédent.

3. The Data Tables

Six tables of monthly and annual temperature data are presented for stations arranged in alphabetical order by province or territory.

These tables are as follows:

Table

- 1 Mean daily maximum temperature
- 2 Mean daily minimum temperature
- 3 Mean daily temperature
- 4 Standard deviation of mean daily temperature
- 5 Extreme maximum temperature
- 6 Extreme minimum temperature

Temperatures are expressed in degrees Celsius. The "daily maximum" temperature for any month is the mean of all daily maximum temperatures recorded in that particular month. The normal is an average of the set of 30 monthly means. The "daily minimum" temperature is similarly derived from all daily minimum temperatures. The "daily" temperature is the average of the mean daily maximum and minimum temperatures. The annual mean temperature is obtained by averaging the 12 monthly values.

Standard deviations of the monthly and annual mean daily temperatures ($^{\circ}\text{C}$) are calculated from the same data used to calculate the mean daily temperature. It is a measure of the year-to-year variability.

The temperature extremes are the highest maximum and lowest minimum values observed during the entire period of record at each station up to and including 1980. In each case the number of years of record is given on the line below the extreme.

temperature $^{\circ}\text{C}$

M missing

4. Climate Normals

Climatologists have generally adopted an arbitrary 30-year period as a standard reference period for normals. The use of 30 years produces fairly constant values with little difference occurring between successive normal periods. However, it should be noted that the choice of 30 years and the use of the term "normal" climate can be misleading.

The number of years needed to obtain a stable normal value depends on the element, season and region. It should also be remembered that

3. Tableaux de données

On présente six tableaux de données mensuelles et annuelles sur la température. Les stations sont rangées alphabétiquement par province et par territoire.

Les tableaux se présentent comme suit:

Tableau

- 1 Température maximale quotidienne moyenne
- 2 Température minimale quotidienne moyenne
- 3 Température quotidienne moyenne
- 4 Écart type de la température quotidienne moyenne
- 5 Température maximale extrême
- 6 Température minimale extrême

Les températures sont exprimées en degrés Celsius. La température "quotidienne maximale" d'un mois donné est la moyenne de toutes les températures quotidiennes maximales enregistrées au cours du mois. La normale est établie comme la moyenne de 30 moyennes mensuelles. À partir de toutes les températures quotidiennes minimales, on calcule de la même façon la température "quotidienne minimale" moyenne. La température "quotidienne" moyenne est la moyenne des températures quotidiennes maximales et minimales. On obtient la température annuelle moyenne en faisant la moyenne des 12 valeurs mensuelles.

On calcule l'écart type des moyennes mensuelle et annuelle des températures quotidiennes moyennes (degrés Celsius) à partir des données utilisées pour calculer la température quotidienne moyenne. On mesure ainsi la variabilité d'année en année.

Les températures extrêmes sont le maximum et le minimum qui ont été observés à chaque station au cours de la période totale d'enregistrement (jusqu'à et y compris 1980). Dans chaque cas, le nombre d'années d'enregistrement figure au-dessous de cet extrême.

4. Normales climatiques

Les climatologues ont adopté en général une période arbitraire de 30 ans comme période de référence standard pour les normales. L'usage de cette période de 30 ans donne des valeurs assez stables, avec des différences minimales entre les périodes consécutives de normales. Toutefois il faut noter que le choix de 30 années et l'emploi du terme climat "normal" peuvent donner lieu à des malentendus.

Le nombre d'années nécessaire pour déterminer une valeur normale stable dépend de ce qui

the period of record is not unrelated to the purpose. For example, if statistics are intended to represent average conditions over the very recent past, then a short period of record, say 10 to 15 years, lessens the possibility of inconsistencies in the time series arising from changes in: station location, instrument exposure, observing standards, instrumentation or observer. On the other hand, for studies of climate variability it is desirable to use the longest possible period of record, based on both instrumental and historical records.

est mesuré, de la saison et de la région. On devrait garder à l'esprit le fait que la période sur laquelle ont porté les enregistrements n'est pas sans avoir ses répercussions; par exemple, si des statistiques sont destinées à représenter des conditions prévalant sur un passé récent, une courte période d'enregistrement, 10 à 15 années diminue les possibilités d'inconsistance résultant de changements tels que: l'endroit de la station, l'exposition des instruments, les normes d'observation, les instruments ou l'observateur lui-même. D'un autre côté, si l'on étudie la variabilité du climat, il est préférable d'utiliser la plus longue période d'enregistrement possible reposant à la fois sur les relevés historiques et ceux réalisés à partir d'instruments.

4.1 Computing Normals – full-period stations

In the computation of the temperature normals for the period 1951 to 1980, the normals for stations with a complete 30-year record are simply arithmetic averages of the 30 years of data. Stations with record lengths between 20 and 29 years invariably yield values that differ only slightly from the 30-year mean so that these data were similarly averaged, i.e. no adjustment made.

4.2 Criteria for Adjusting Data — short-period stations

The averages for most short-period stations were adjusted to make them comparable with those for full-period stations. The adjustment (described below) was made whenever a station had 5 to 19 years of data, in the 1951-1980 period. Additional available data from the period 1931 to 1950 were also used to adjust station normals.

4.3 Selecting Paired Data for Adjustment

A good *standard* station was selected for each of the 79 climate districts regularly used by the Atmospheric Environment Service to archive data. The districts are delineated by drainage basin and generally have fairly similar climate and physiographic characteristics. A standard station is one that has an observational record of sufficient length (28 years or more) and quality to serve as a basis for adjusting data for nearby stations. At least one, but generally five or six, standard stations exist in each district.

4.1 Calcul des normales – période entière

Dans le calcul des normales de température et de précipitations pour la période 1951-1980, les normales des stations qui disposent de relevés complets pour 30 années correspondent à la moyenne des données sur 30 ans. Les stations qui disposent de relevés pour 20 à 29 années ont des valeurs qui diffèrent très peu des moyennes sur 30 années; ces données n'ont donc pas été ajustées.

4.2 Critères d'ajustement des données – période courte

On a ajusté les moyennes pour la plupart des stations dont les relevés couvrent de courtes périodes, afin de pouvoir comparer ces moyennes à celles des stations disposant de relevés complets. L'ajustement décrit ci-dessous a été utilisé quand une station offrait 5 à 19 ans de données pour la période 1951-1980. Les données supplémentaires disponibles pour la période 1931-1950 ont aussi été utilisées pour l'ajustement des normales.

4.3 Choix des données appariées pour l'ajustement

On a choisi une station standard de haute qualité pour chacun des 79 districts climatologiques utilisés par le Service de l'environnement atmosphérique pour l'archivage des données. Les districts ont été délimités par bassin versant et possèdent en général des caractéristiques climatiques et physiographiques assez homogènes. Une station standard est une station dont les relevés d'observation sont suffisamment complets (au moins 28 ans) et suffisamment bons pour ajuster les normales climatiques des stations avoisinantes. Chaque district compte au moins

Provided there were at least five years of data to make a valid comparison, monthly values at the short-period station were paired with corresponding values for each standard station in the climate district. A simple correlation between paired station data was computed and tested for significance. Then the paired stations with the highest significant correlation were selected. Finally an adjustment technique was used to estimate the normals.

4.4 Adjustment Techniques

Data reconstruction and estimation procedures are common in climatology for filling data gaps, for checking doubtful values in a record or for synthesizing normals for stations with short-period records. The method involves using concurrent data from one or more nearby stations in the same climate regime. The adjustment technique used, either the difference or the ratio method, depends on the meteorological element whose statistics are being adjusted.

The "difference" adjustment works well for temperature: the difference between the means of two concurrent temperature series is used as an additive factor. Monthly averages were calculated for the period of available data for the short-term station and for the corresponding period for the standard station selected. The difference between these averages was the correction added to the normal for the standard station in order to estimate an adjusted normal for the given station.

5. Code for Length of Record

Each normal of temperature is based on averages obtained over a number of years in the 1951-1980 period. A code number is assigned to each normal to identify the average number of years used in the calculation and appears in the column labelled "CODE". The average period of record is identified through the use of the following code numbers:

une station standard; généralement, il y a cinq ou six stations standard par district.

Si les relevés couvrent au moins cinq ans, pour faire une comparaison valable, on apparie plusieurs années de valeurs mensuelles enregistrées à une station sur une courte période, aux valeurs mensuelles correspondantes de chaque station standard à l'intérieur du district climatologique. Ensuite, on établit et on vérifie une corrélation simple entre les données appariées. Enfin, on choisit les stations appariées dont le coefficient de corrélation est le plus élevé et on utilise une technique d'ajustement pour déterminer les normales.

4.4 Techniques d'ajustement

On se sert couramment de méthodes de reconstruction et d'estimation de données en climatologie pour combler les manques de données, vérifier les valeurs contestables d'un relevé, ou faire la synthèse des normales dans les stations où les relevés couvrent une courte période. On utilise les données concourantes d'une ou plusieurs stations voisines situées dans le même régime climatique. La technique d'ajustement se base soit sur la méthode des différences où celle des quotients et dépend de l'élément météorologique dont il faut ajuster les statistiques.

L'ajustement des différences convient très bien pour les températures: la différence entre les moyennes de deux séries de températures concourantes est utilisée comme facteur de correction ajouté. On calcule les moyennes mensuelles pour la station où la période de relevés est courte puis pour la période correspondante à la station standard choisie. La différence entre ces moyennes est la de correction ajoutée à la normale de la station standard afin d'estimer une normale ajustée à la station considérée.

5. Code des périodes d'enregistrement

Chaque normale de température repose sur des moyennes obtenues à partir d'un certain nombre d'années durant la période 1951-1980. Un numéro de code est donné à chaque normale pour identifier le nombre moyen d'années utilisé dans le calcul et se retrouve dans la colonne "CODE".

Code

- 1 complete 30 years
- 2 25 to 29 years
- 3 20 to 24 years
- 4 15 to 19 years
- 5 10 to 14 years
- 6 less than 10 years but more than 4 years
- 7 not assigned
- 8 adjusted normals based on 5 to 19 years, inclusive, from 1951 to 1980 and any other available data from 1931 to 1950.

Code

- 1 30 années au complet
- 2 25 à 30 années
- 3 20 à 24 années
- 4 15 à 19 années
- 5 10 à 14 années
- 6 moins de 10 années mais plus de 4
- 7 libre
- 8 normales ajustées sur la base de 5 à 19 années, de 1951 à 1980 et toutes données disponibles de 1931 à 1950.

6. Acknowledgements

This series of publications is dedicated to the hundreds of volunteer weather observers across Canada. Publication of any climate normals involves many persons beginning with those who made the original observations. Years of faithful and accurate weather observing are required to generate the data from which normals may be calculated. For example, it takes almost 22,000 separate observations to calculate an annual normal for one station.

Quality control, archiving, computer programming and publishing are just a few of the other tasks that must be performed. D.W. Phillips coordinated the project to produce the 1951-1980 normals and long period abstracts; D. Aston prepared program and data specifications and designed publication layouts; Mrs. J. Blackburn and F. Yates supervised the writing of several programs; Y. Durocher developed the data adjustment technique and W. Johnson designed the cover.

6. Remerciements

La publication de normales climatiques est toujours l'oeuvre de tout un groupe, dont font partie les personnes qui ont relevé les observations initiales. Il faut des années d'observations météorologiques fidèles et précises pour générer les données à partir desquelles on calcule les normales. Ainsi, le calcul de la normale annuelle d'une seule station demande près de 22,000 observations distinctes.

Il a fallu entre autres exécuter un contrôle de la qualité, de l'archivage, de la programmation informatique et de la publication. D.W. Phillips a coordonné le projet en vue de produire les normales pour la période 1951-1980 et les précis pour les longues périodes; D. Aston a préparé les spécifications des programmes et des données et a conçu la mise en page de la publication; Mme J. Blackburn et F. Yates ont dirigé la rédaction de plusieurs programmes; Y. Durocher a mis au point la technique d'ajustement des données et W. Johnson a conçu la page de couverture.

TO ORDER CLIMATE PUBLICATIONS

Each year the Atmospheric Environment Service publishes climate data and information in a number of current or historical periodicals. Most of the publications are available on subscription. Many one-time publications containing specialized information on statistical summary sheets, in normals booklets, in bibliographies and in atlases are issued on occasion. Information about the contents and format of these publications and how copies may be obtained is available from the Atmospheric Environment Service upon request.

Generally, the front-line supplier of climate information is the regional climatological specialist or his equivalent. For items of an inter-regional, national or international nature, the enquirer should contact the Canadian Climate Centre. The name and address of the office from which subscriptions or copies of publications may be obtained are shown below.

REGIONAL OFFICES:

Director, Pacific Region
Atmospheric Environment Service
700-1200 W., 73rd Avenue
Vancouver, B.C. V6P 6H9
Attn: Scientific Services

Director, Western Region
Atmospheric Environment Service
Argyll Centre
6325 - 103 Street
Edmonton, Alberta T6H 5H6
Attn: Scientific Services

Director, Central Region
Atmospheric Environment Service
Room 1000
266 Graham Avenue
Winnipeg, Manitoba R3C 3V4
Attn: Scientific Services

Director, Ontario Region
Atmospheric Environment Service
25 St. Clair Avenue, East
Toronto, Ontario M4T 1M2
Attn: Scientific Services

Director, Quebec Region
Atmospheric Environment Service
100 Alexis Nihon Blvd., 3rd Floor

Attn: Scientific Services

CANADIAN CLIMATE CENTRE:

Assistant Deputy Minister
Atmospheric Environment Service
4905 Dufferin Street
Downsview, Ontario M3H 5T4
Attn: Climatological Services Division

Remittances by cheque or money order should be made payable to the Receiver General for Canada. For a list of publications send for a copy of Selected Publications in Climatology and Applied Meteorology.

COMMENT SE PROCURER DES PUBLICATIONS CLIMATOLOGIQUES

Chaque année, le Service de l'environnement atmosphérique publie des données et des renseignements climatologiques dans plusieurs périodiques de données courantes ou passées. On peut s'abonner à la plupart de ces publications. À l'occasion, on fait paraître de nombreuses publications à tirage unique contenant des informations spécialisées sous forme de feuillets de données résumés, de livrets de normales, de bibliographies et d'atlas. On peut se renseigner sur le contenu et la présentation de ces publications, ainsi que sur la façon de s'en procurer des exemplaires en s'adressant au Service de l'environnement atmosphérique.

En général, c'est le spécialiste régional en climatologie ou son homologue qui constitue la source immédiate de renseignements climatologiques. Pour les questions de nature inter-regionale, nationale ou internationale, le demandeur doit communiquer avec le Centre météorologique canadien. Vous trouverez ci-après les nom et adresse des bureaux où l'on peut s'abonner ou se procurer des exemplaires de ces publications.

BUREAUX RÉGIONAUX

Le directeur de la Région du Pacifique
Service de l'environnement atmosphérique
700 à 1200, 73^e avenue ouest
